A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

Repeated measures model analysis (observed values) - Lupus QoL Emotional Health domain score - Subgroup analysis
Full analysis set (referred to as a 'modified Intent-to-treat' population in study CSR)

Subgroup Level	Anifrolumab 300mg (N=99) N	LSMean (SE)	Placebo (N=102) N	LSMean (SE)	Difference of LSMeans (SE)	(95% CI)	p-Value	Hedges'g (SE)	(95% CI)	p-Value	Interaction p-Value
No	20	5.83 (2.78)	13	4.99 (3.15)	0.84 (4.15)	(-7.64, 9.32)	0.8409	0.07 (0.36)	(-0.63, 0.77)	0.8484	
SLICC score											0.2062
0	61	7.71 (2.10)	65	9.66 (2.20)	-1.95 (2.85)	(-7.59, 3.70)	0.4959	-0.11 (0.18)	(-0.46, 0.24)	0.5261	
>=1	37	12.09 (2.95)	35	7.94 (2.90)	4.15 (3.89)	(-3.63, 11.93)	0.2904	0.23 (0.24)	(-0.23, 0.70)	0.3234	

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for heterogenity between studies from test for heterogeneity of the mean differences in the studies using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

Anifrolumab (MEDI-546)
D3461C00005 (TULIP SLE Study 1) + D3461C00004 (TULIP SLE Study 2) + D3461C00001 (MUSE) Meta-Analysis - Anifrolumab 300mg vs. Placebo population
Repeated measures model analysis (observed values) - SF-36 v2.0 Acute Mental Component Score

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

Anifrolumab (MEDI-546)
D3461C00005 (TULIP SLE Study 1) + D3461C00004 (TULIP SLE Study 2) + D3461C00001 (MUSE) Meta-Analysis - Anifrolumab 300mg vs. Placebo population
Repeated measures model analysis (observed values) - SF-36 v2.0 Acute General Health Score

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

Anifrolumab (MEDI-546)
D3461C00005 (TULIP SLE Study 1) + D3461C00004 (TULIP SLE Study 2) + D3461C00001 (MUSE) Meta-Analysis - Anifrolumab 300mg vs. Placebo population
Repeated measures model analysis (observed values) - SF-36 v2.0 Acute Physical Functioning Score
Full analysis set

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

Anifrolumab (MEDI-546)
D3461C00005 (TULIP SLE Study 1) + D3461C00004 (TULIP SLE Study 2) + D3461C00001 (MUSE) Meta-Analysis - Anifrolumab 300mg vs. Placebo population
Repeated measures model analysis (observed values) - SF-36 v2.0 Acute Role Physical Score

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

Anifrolumab (MEDI-546)
D3461C00005 (TULIP SLE Study 1) + D3461C00004 (TULIP SLE Study 2) + D3461C00001 (MUSE) Meta-Analysis - Anifrolumab 300mg vs. Placebo population
Repeated measures model analysis (observed values) - SF-36 v2.0 Acute Bodily Pain Score

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

Anifrolumab (MEDI-546)

Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for heterogenity between studies from test for heterogeneity of the mean differences in the studies using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for heterogenity between studies from test for heterogeneity of the mean differences in the studies using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

A repeated measures model with fixed effects for baseline value, treatment group, visit, treatment*visit interaction and stratification factors was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model, e.g. subjects with non-missing baseline and at least one non-missing post-baseline value.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochranes Q statistic.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

Rates and rate ratio from negative binomial regression model with factors for treatment group and the stratification factors. The logarithm (to base e) of the follow-up time is used as an offset variable in the model to adjust for subjects having different exposure times.
Study*treatment interaction also included to assess heterogenity between studies.
p-Value for interaction from same negative binomial regression model with additional factors for subgroup and subgroup*treatment interaction.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].

Anifrolumab (MEDI-546)
D3461C00005 (TULIP SLE Study 1) + D3461C00004 (TULIP SLE Study 2) + D3461C00001 (MUSE) Meta-Analysis - Anifrolumab 300mg vs. Placebo population
Overall Survival
Full analysis set

	Anifrolumab 300mg (N=459)	Placebo (N=468)
Number of subjects with events, n (%)	2 (0.4)	1 (0.2)
Number of censored subjects, n (%)	457 (99.6)	467 (99.8)

25%-ile (95% CI)	NE (NE, NE)	NE (NE, NE)
Median (95% CI)	NE (NE, NE)	NE (NE, NE)
75%-ile (95% CI)	NE (NE, NE)	NE (NE, NE)
Analysis Anifrolumab 300mg vs. Placebo (adjusted)		
Hazard Ratio (95% CI)	1.74 (0.16, 19.26)	
p-value	0.6652	
Analysis Anifrolumab 300mg vs. Placebo (unadjusted)		
Hazard Ratio (95% CI)	2.02 (0.18, 22.31)	
p-value	0.5604	
p-Value for test for heterogenity between studies	1.0000	

Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratios, confidence intervals and 2-sided p-value are calculated from Cox proportional hazards model. Adjusted analysis also includes stratification factors in the model.
Two-sided log rank test used.
p-Value for heterogenity between studies from Cox proportional hazards model with factors for treatment, study, treatment*study interaction and stratfication factors.
Stratification factors: Study [Tulip1, Tulip2, MUSE], SLEDAI-2K score at screening [<10 points vs >= 10 points], Week 0 OCS dose [<10 mg/day vs >=10 mg/day prednisone or equivalent] and type I IFN gene signature test result at screening [high vs low].
Unadjusted analysis also includes factor for study.

D3461C00005 (TULIP SLE Study 1) + D3461C00004 (TULIP SLE Study 2) + D3461C00001 (MUSE) Meta-Analysis - Anifrolumab 300mg vs. Placebo population
Proportion of patients with at least one frequent Adverse Events by SOC, PT (incidence in either arm >= 10% or >=10 patients)
Full analysis set (Tulip1,Tulip2) & Safety analysis set (MUSE)

SOC / PT		Anifrolumab 300mg (N=459)	Placebo (N=467)
SOC: Respiratory, thoracic and mediastinal disorders	Number of subjects with events, n (%)	64 (13.9)	59 (12.6)
	Analysis Anifrolumab 300mg vs. Placebo		
	Relative Risk (95% CI)	1.11 (0.79, 1.54)	
	p-value	0.5502	
	Odds Ratio (95% CI)	1.12 (0.77, 1.64)	
	p-value	0.5581	
	Risk Difference (95% CI)	1.31 (-3.05, 5.68)	
	p-value	0.5558	
	p-Value for test for heterogenity between studies	0.5746	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= date of last dose of investigational product + 28 days.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)
p-Value for heterogenity between studies from test for heterogeneity of the relative risks in the studies using Cochranes Q statistic.
Analysis of Relative Risks, Odds Ratios and Risk Differences includes factor for study.

A repeated measures model with fixed effects for baseline value, treatment group, visit and treatment*visit interaction was used.
N defines number of subjects included in the repeated measures model.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.

A repeated measures model with fixed effects for baseline value, treatment group, visit and treatment*visit interaction was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochrane>s Q statistic.

A repeated measures model with fixed effects for baseline value, treatment group, visit and treatment*visit interaction was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochrane>s Q statistic.

Risk Difference (95% CI)	6.50 (1.01, 12.00)	
p-value	0.0203	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Risk Difference (95% CI)	0.00 (-1.12, 1.12)	
p-value	1.0000	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

p-value		

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

	p-value	0.0002	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population receiving standard of care treatment approved in Germany
Summary of Incidence and time to first frequent Adverse Event by SOC, PT during treatment (incidence in either arm >= 10% or >=10 patients)
Full analysis set

	p-value	0.1028	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population receiving standard of care treatment approved in Germany
Summary of Incidence and time to first frequent Adverse Event by SOC, PT during treatment (incidence in either arm >= 10% or >=10 patients)
Full analysis set

	p-value	0.2164	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

	Odds Ratio (95% CI)	0.94 (0.48, 1.84)	
	p-value	0.8643	
	Risk Difference (95% CI)	-0.41 (-5.07, 4.25)	
	p-value	0.8643	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population receiving standard of care treatment approved in Germany
Summary of Incidence and time to first frequent Serious Adverse Events by SOC, PT during treatment (incidence in either arm >= 5% or >=10 patients)
Full analysis set

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population receiving standard of care treatment approved in Germany
Summary of time to first Adverse Event during study (Study 09)
Full analysis set

	Anifrolumab 300mg (N=173)	Placebo Feeder + Placebo LTE (N=72)	Placebo Feeder + Anifrolumab 300mg (N=73)	Anifrolumab 150mg + Anifrolumab 300mg (N=52)
Number of subjects with events, n (%)	144 (83.2)	56 (77.8)	54 (74.0)	45 (86.5)
Number of censored subjects, n (%)	29 (39.7)	16 (22.2)	19 (26.0)	7 (9.7)
Exposure years	125.2	48.8	59.0	35.8
EAIR per 100 PY	115.0	114.7	91.5	125.8

Analysis includes all AE with a date of onset >= day of first dose of investigational in study 09 and <= end of study day in study 09.
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product in study 09 to the minimum of date of first event or end of study.

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population receiving standard of care treatment approved in Germany
Summary of time to first Adverse Event of Special Interest (AESI) during study (Study 09) - Severe Non-opportunistic infection
Full analysis set

	Anifrolumab 300mg (N=173)	Placebo Feeder + Placebo LTE (N=72)	Placebo Feeder + Anifrolumab 300mg (N=73)	Anifrolumab 150mg + Anifrolumab 300mg (N=52)
Number of subjects with events, n (%)	7 (4.0)	1 (1.4)	2 (2.7)	3 (5.8)
Number of censored subjects, n (%)	166 (227.4)	71 (98.6)	71 (97.3)	49 (68.1)
Exposure years	362.6	144.6	158.9	108.7
EAIR per 100 PY	1.9	0.7	1.3	2.8

Analysis includes all AE with a date of onset >= day of first dose of investigational in study 09 and <= end of study day in study 09.
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product in study 09 to the minimum of date of first event or end of study.

A repeated measures model with fixed effects for baseline value, treatment group, visit and treatment*visit interaction was used.
N defines number of subjects included in the repeated measures model.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.

A repeated measures model with fixed effects for baseline value, treatment group, visit and treatment*visit interaction was used.
Overall treatment estimates are displayed.
N defines number of subjects included in the repeated measures model.
An approximate standard deviation was calculated for each arm based on the standard error of the LS mean to obtain the pooled standard deviation for Hedges>g.
p-Value for interaction from test for heterogeneity of the mean differences in the subgroups using Cochrane>s Q statistic.

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Summary of time to first Adverse Event during treatment - Randomised Anifrolumab 300mg vs. Randomised Placebo
Full analysis set

	Ramdomised ANI300 (N=360)	Randomised Placebo (N=365)
Number of subjects with events, n (%)	336 (93.3)	316 (86.6)
Number of censored subjects, n (%)	24 (6.7)	49 (13.4)
Exposure years	144.4	151.4
EAIR per 100 PY	232.6	208.8
Kaplan-Meier Quartiles of Time to Event (weeks)		
25%-ile (95% CI)	2.86 (2.00, 3.57)	4.14 (2.86, 4.86)
Median (95% CI)	7.71 (6.57, 10.00)	11.86 (9.57, 13.86)
75%-ile (95% CI)	23.00 (19.00, 27.14)	32.29 (26.14, 39.14)
Analysis Ramdomised ANI300 vs. Randomised Placebo		
Hazard Ratio (95% CI)	1.23 (1.05, 1.43)	
p-value	0.0091	
Relative Risk (95% CI)	1.08 (1.03, 1.13)	
p-value	0.0026	
Odds Ratio (95% CI)	2.17 (1.30, 3.62)	
p-value	0.0030	
Risk Difference (95% CI)	6.76 (2.41, 11.10)	
p-value	0.0023	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Median (95% CI)	8.00 (7.00, 10.14)	12.00 (9.71, 14.00)
75%-ile (95% CI)	23.00 (19.43, 27.86)	33.57 (27.71, 39.86)
Analysis Ramdomised ANI300 vs. Randomised Placebo		
Hazard Ratio (95% CI)	1.23 (1.05, 1.43)	
p-value	0.0099	
Relative Risk (95% CI)	1.08 (1.02, 1.14)	
p-value	0.0037	
Odds Ratio (95% CI)	2.05 (1.26, 3.34)	
p-value	0.0041	
Risk Difference (95% CI)	6.75 (2.25, 11.25)	
p-value	0.0033	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

p-value	<.0001	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Risk Difference (95% CI)	2.54 (-0.40, 5.49)	
p-value	0.0907	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Summary of time to first Adverse Event of Special Interest (AESI) during treatment - Randomised Anifrolumab 300mg vs. Randomised Placebo - Severe Non-opportunistic infection
Full analysis set

	Ramdomised ANI300 (N=360)	Randomised Placebo (N=365)
Number of subjects with events, n (%)	27 (7.5)	10 (2.7)
Number of censored subjects, n (%)	333 (92.5)	355 (97.3)
Exposure years	839.7	519.2
EAIR per 100 PY	3.2	1.9
Kaplan-Meier Quartiles of Time to Event (weeks)		
25%-ile (95% CI)	NE (NE, NE)	NE (NE, NE)
Median (95% CI)	NE (NE, NE)	NE (NE, NE)
75%-ile (95% CI)	NE (NE, NE)	NE (NE, NE)
Analysis Ramdomised ANI300 vs. Randomised Placebo		
Hazard Ratio (95% CI)	1.83 (0.87, 3.82)	
p-value	0.1053	
Relative Risk (95% CI)	2.74 (1.34, 5.57)	
p-value	0.0055	
Odds Ratio (95% CI)	2.88 (1.37, 6.04)	
p-value	0.0052	
Risk Difference (95% CI)	4.76 (1.57, 7.96)	
p-value	0.0035	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

	p-value	0.0065	
	Risk Difference (95% CI)	3.62 (1.30, 5.94)	
	p-value	0.0022	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Anifrolumab (MEDI-546)

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Summary of Incidence and time to first frequent Adverse Event by SOC, PT during treatment (incidence in either arm >= 10% or >=10 patients)
Full analysis set

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Summary of Incidence and time to first frequent Adverse Event by SOC, PT during treatment (incidence in either arm >= 10% or >=10 patients)
Full analysis set

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Kaplan-Meier Plot of Incidence and time to first frequent Adverse Event by SOC, PT during treatment (incidence in either arm >= 10% or >=10 patients)
Full analysis set

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
Kaplan Meier Plots are only generated if test for interaction is significant (alpha=0.05).

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Kaplan-Meier Plot of Incidence and time to first frequent Adverse Event by SOC, PT during treatment (incidence in either arm >= 10% or >=10 patients)
Full analysis set

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
Kaplan Meier Plots are only generated if test for interaction is significant (alpha=0.05).

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Kaplan-Meier Plot of Incidence and time to first frequent Adverse Event by SOC, PT during treatment (incidence in either arm >= 10% or >=10 patients)
Full analysis set

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).

	Relative Risk (95% CI)	1.18 (0.74, 1.88)	
	p-value	0.4794	
	Odds Ratio (95% CI)	1.20 (0.72, 2.00)	
	p-value	0.4792	
	Risk Difference (95% CI)	1.50 (-2.66, 5.66)	
	p-value	0.4788	

Analysis includes all AE with a date of onset >= day of first dose of investigational product and <= minimum (last dosing date + 28 days, end of study date, death date).
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product to the minimum of date of first event, death, end of treatment + 28 days or end of study.
Kaplan-Meier estimate with 95% CI based on Brookmeyer-Crowley log(-log) transformation.
Hazard ratio and confidence interval are calculated from Cox proportional hazards model.
Two-sided log rank test used.
Relative Risks, Odds Ratios and Risk Differences estimated using Mantel-Haenszel method. Confidence limits and p-value calculated using normal approximation (Wald)

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Summary of time to first Adverse Event during study (Study 09)
Full analysis set

	Anifrolumab 300mg (N=259)	Placebo Feeder + Placebo LTE (N=113)	Placebo Feeder + Anifrolumab 300mg (N=115)	Anifrolumab 150mg + Anifrolumab 300mg (N=69)
Number of subjects with events, n (%)	220 (84.9)	90 (79.6)	92 (80.0)	61 (88.4)
Number of censored subjects, n (%)	39 (33.9)	23 (20.4)	23 (20.0)	8 (7.1)
Exposure years	168.6	66.8	79.4	45.7
EAIR per 100 PY	130.5	134.6	115.9	133.5

Analysis includes all AE with a date of onset >= day of first dose of investigational in study 09 and <= end of study day in study 09.
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product in study 09 to the minimum of date of first event or end of study.

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Summary of time to first Serious Adverse Event during study (Study 09)
Full analysis set

	Anifrolumab 300mg (N=259)	Placebo Feeder + Placebo LTE (N=113)	Placebo Feeder + Anifrolumab 300mg (N=115)	Anifrolumab 150mg + Anifrolumab 300mg (N=69)
Number of subjects with events, n (%)	47 (18.1)	27 (23.9)	25 (21.7)	17 (24.6)
Number of censored subjects, n (%)	212 (184.3)	86 (76.1)	90 (78.3)	52 (46.0)
Exposure years	506.2	193.9	215.7	132.5
EAIR per 100 PY	9.3	13.9	11.6	12.8

Analysis includes all AE with a date of onset >= day of first dose of investigational in study 09 and <= end of study day in study 09.
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product in study 09 to the minimum of date of first event or end of study.

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Summary of time to first Severe Adverse Event during study (Study 09)
Full analysis set

	Anifrolumab 300mg (N=259)	Placebo Feeder + Placebo LTE (N=113)	Placebo Feeder + Anifrolumab 300mg (N=115)	Anifrolumab 150mg + Anifrolumab 300mg (N=69)

Summary of time to first Adverse Event of Special Interest (AESI) during study (Study 09) - Influenza
Full analysis set

	Anifrolumab 300mg (N=259)	Placebo Feeder + Placebo LTE (N=113)	Placebo Feeder + Anifrolumab 300mg (N=115)	Anifrolumab 150mg + Anifrolumab 300mg (N=69)
Number of subjects with events, n (%)	15 (5.8)	4 (3.5)	9 (7.8)	6 (8.7)
Number of censored subjects, n (%)	244 (212.2)	109 (96.5)	106 (92.2)	63 (55.8)
Exposure years	550.7	222.1	239.6	146.4
EAIR per 100 PY	2.7	1.8	3.8	4.1

Analysis includes all AE with a date of onset >= day of first dose of investigational in study 09 and <= end of study day in study 09.
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product in study 09 to the minimum of date of first event or end of study.

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Summary of time to first Adverse Event of Special Interest (AESI) during study (Study 09) - Serious Influenza
Full analysis set

	Anifrolumab 300mg (N=259)	Placebo Feeder + Placebo LTE (N=113)	Placebo Feeder + Anifrolumab 300mg (N=115)	Anifrolumab 150mg + Anifrolumab 300mg (N=69)

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Summary of time to first Adverse Event of Special Interest (AESI) during study (Study 09) - Non-Severe Tuberculosis (including latent TB)
Full analysis set

	Anifrolumab 300mg (N=259)	Placebo Feeder + Placebo LTE (N=113)	Placebo Feeder + Anifrolumab 300mg (N=115)	Anifrolumab 150mg + Anifrolumab 300mg (N=69)
Number of subjects with events, n (%)	16 (6.2)	2 (1.8)	4 (3.5)	0 (0.0)
Number of censored subjects, n (%)	243 (211.3)	111 (98.2)	111 (96.5)	69 (61.1)
Exposure years	549.4	219.7	246.3	151.2
EAIR per 100 PY	2.9	0.9	1.6	0.0

Analysis includes all AE with a date of onset >= day of first dose of investigational in study 09 and <= end of study day in study 09.
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product in study 09 to the minimum of date of first event or end of study.

Anifrolumab (MEDI-546)
D3461C00009 (LTE Study) - Anifrolumab 300mg vs. Placebo population
Summary of time to first Adverse Event of Special Interest (AESI) during study (Study 09) - Vasculitis
Full analysis set

	Anifrolumab 300mg (N=259)	Placebo Feeder + Placebo LTE (N=113)	Placebo Feeder + Anifrolumab 300mg (N=115)	Anifrolumab 150mg + Anifrolumab 300mg (N=69)
Number of subjects with events, n (%)	0 (0.0)	1 (0.9)	1 (0.9)	0 (0.0)
Number of censored subjects, n (%)	259 (225.2)	112 (99.1)	114 (99.1)	69 (61.1)
Exposure years	565.2	222.8	249.0	151.2
EAIR per 100 PY	0.0	0.4	0.4	0.0

Analysis includes all AE with a date of onset >= day of first dose of investigational in study 09 and <= end of study day in study 09.
The exposure-adjusted incidence rate (EAYR) per 100 patient-years is defined as the number of patients with the specific event divided by the total exposure time in years and then multiplied by 100.
The exposure time is defined as from the date of first administration of investigational product in study 09 to the minimum of date of first event or end of study.
